

FuelBuddy is quick and easy to install. No tools are necessary. It's as easy as 1-2-3!

STEP 1: Locate accessible area on fuel line after fuel filter and before combustion area (carburetor). Situate unit closest to combustion point.

STEP 2: Place the 2 FuelBuddy halves around the fuel line. Be sure that the arrows are pointing towards combustion area in direction of fuel flow (towards engine).

STEP 3: Thread the 4 plastic ties through the slots on the sides of the unit. Pull snug try to make it a nice, even fit, that the space between the halves is the same all around.

STEP 4: Be sure assembly is snug around the fuel line, but do not over-tighten. No further maintenance is required, but we suggest you visually inspect installation periodically for reliability.

You're done! You can trim excess plastic ties, but leave approximately ¼ inch protruding. FuelBuddy must be installed only on the inbound fuel line that supplies fuel to the engine in order to work its fuel savings and emission reduction benefits for your vehicles. The closer to the point of combustion you can place the FuelBuddy, the better.

FuelBuddy begins working as soon as it is properly installed on the inbound fuel line of your engine.
